

# the **global** region

first commercial microprocessor chip - 2,300 transistors

Skylake chip - 1.75 billion transistors  
500,000 would fit on a single 4004 transistor  
deliver 400,000 x the computing muscle

if cars progressed at the same rate, the fastest would travel at 67,061,662 miles per hour

the tallest building would now reach half way to the moon

is **3D printing** the most disruptive technology today

| global **population** shift

population **dome** - calgary

1986 - typical resident = late **20s**

2030 - mid **40s** +

**1,600%** increase in seniors - 2050

ratio of **working** aged adults to seniors - calgary

	<u>2011</u>	<u>2019</u>	<u>2029</u>	<u>2039</u>
ratio	6.1	4.0	3.1	2.7

**58%** drop in 30 yrs

by 2050

usa will need **35** million more workers than natural growth gives

japan **17**

europa **80**

canada **1** by 2020 restricted foreign temp workers

global economic **centre** is shifting to emerging markets

making things **cheap** is not the most important thing anymore

trend is to making things **smart**

| innovation

rochester ny was the place for optical imaging  
Kodak 1982 employed 62,000  
today = 7,000

## high tech **job** creation

5 to 1      3 x multiplier effect of manufacturing

GM      79,000 employees

facebook 2,500      multiplier = 53,000 new jobs  
130,000 related services  
\$12 billion in salaries & benefits

**10%** of USA jobs are innovation sector  
manufacturing at its height was **30%**

**67%** of the 27 million jobs created in 20 yrs  
are innovation jobs

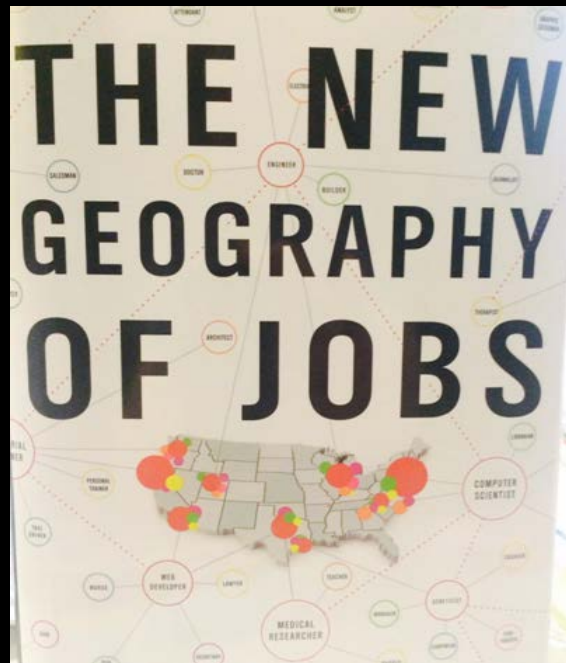

USA software jobs > 562 %  
life sciences jobs > 300 %

where does the pacific northwest **fit** into all this?

does our innovation sector **design** innovation?

the power of **regions**

can the northwest lead in new **construction** technologies?

## railroad tracks

The US standard railroad gauge is 4 feet, 8.5 inches. An odd number.

Why was that gauge used? Because that's the way they built them in England and English expatriates built the US railroads.

The English used that gauge because the first rail lines were built by the same people who built the pre-railroad tramways and that's the gauge they used.

Why did 'they' use that gauge? Because the people who built the tramways used the jigs and tools used for building wagons, which used that wheel spacing.

Why did the wagons have such odd wheel spacing? Well, if they tried to use any other spacing, the wagon wheels would break on the old, long distance roads in England, because that's the spacing of the wheel ruts.

So who built those old rutted roads?

Imperial Rome built the first long distance roads in Europe and England for their legions. The roads have been used ever since.

And the ruts in the roads? Roman war chariots formed the initial ruts, which everyone else had to match for fear of destroying their wagon wheels. Therefore the United States standard railroad gauge of 4 feet, 8.5 inches is derived from the original specifications for an Imperial Roman war chariot.

So the next time you are handed a specification / procedure / process and wonder 'What horse's rear came up with it?', you may be exactly right. Imperial Roman army chariots were made just wide enough to accommodate the rear ends of two war horses

The Space Shuttle used two big booster rockets attached to the sides of the fuel tank. Those were rocket boosters made at the factory in Utah. The engineers who designed them would have made them fatter, but the SRB's had to be shipped by train to the launch site two thousand miles away. The railroad line from the factory runs through a tunnel and the SRB's had to fit through that tunnel. The tunnel is slightly wider than the railroad track and the railroad track, as you now know, is about as wide as two horses' behinds.

So, a major Space Shuttle design feature of what is arguably the world's most advanced transportation system was determined over two thousand years ago by the width of a horse's rear end.
